

# FOOD FOR (POLITICAL) THOUGHT: investigating factors and behaviors associated with political inferences from apolitical cues in Italy

**Gaetano Scaduto, Fedra Negri**

University of Milan-Bicocca

Department of Sociology and Social Research

SPS Seminar - Milan, 17/01/2024

The basic idea

From the Alignment to Associations

Introducing policultural linking

Data and methods

Results

Conclusions

Appendix

# The basic idea

**Ambrosi (Fdl): "Noi amiamo il buon cibo e vino, la sinistra gli insetti e le droghe. Ecco perché sono una tipa di destra"**

di Valeria Forgnone

**Emanuele Pozzolo**  • [Segui](#)

2 mag 2021 · 

**AUTODENUNCIA** 

Maschio, bianco, cattolico.

Mangio carne, adoro il foie gras, bevo birra.

Pro-God, pro-gun, pro-life, pro provocazioni.

Testardo eterosessuale, impenitente lettore

# The Alignment

- ▶ Studies show the **correlation between cultural and political preferences** in many cultural fields, such as **music**, **movies**, **art**, and, of course, **food**...
- ▶ Consistently with this, DellaPosta (2020) talked about the "**Oil Spill model**" of political polarization:

Figure: Reelaboration from DellaPosta (2020)

# The Associations

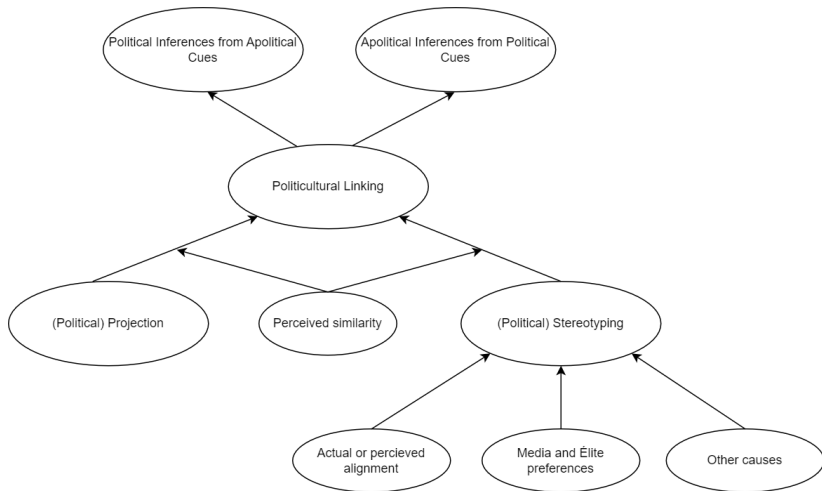

- ▶ Observing the Alignment **broadens the associative network** with political ideologies or partisanship
- ▶ “**Associative Diffusion**” (Goldberg and Stein, 2018) further reinforces the alignment and associations
- ▶ Associations are used to perform **inferences** on the people we interact with (see Carlson and Settle, 2022).
- ▶ Moreover, **élite preferences** or **media representations** could also engender associations

# Defining politicultural linking

- ▶ We introduce a novel concept that has been investigated only through periphrasis such as “making political inferences from apolitical cues” (Carlson and Settle, 2022; Lee, 2021), and mainly in the US context.
- ▶ We call this **politicultural linking (PL)**
- ▶ We define PL as:

*The act of producing inferences about others' political or apolitical characteristics based on the perceived alignments (associations) between these two kinds of characteristics.*

# Where does PL come from? (that's for another paper or for the discussion if you like)

# What, Who, Why: Content, Associations, and Consequences of PL

The present work is divided in three parts:

1. We will observe the **content and direction of PL** in the field of **food**.
  - ▶ **RQ1:** Is there evidence of policultural linking in the field of food in Italy?
2. We will observe **who is more likely to do PL**.
  - ▶ **RQ2:** Which kinds of people can we expect to be more able or prone to policultural link others?
3. We will observe the possible **social consequences of PL**.
  - ▶ **RQ3:** Does PL have negative consequences on (political) cross-group interactions?

# Content and Direction: PL in the Field of Food

- ▶ Studies show that food preferences correlate with ideology in multiple contexts, including Italy (Guidetti et al, 2022). We investigate food preferences within two dimensions:
  - ▶ Vegan vs Carnivore
  - ▶ Ethnic vs Traditional
- ▶ We hypothesize that **vegan and ethnic** food preferences are associated with **left-wing ideology** (H1a, H1c), while **meat and traditional** food preferences are associated with **right-wing ideology** (H1b, H1d).

# Factors associated with PL

Not everyone performs PL at the same level. We hypothesize that:

- ▶ **Ideologues** are more likely to do PL than people who do not place themselves in the LR dimension (**H2**)
- ▶ People showing higher levels of **affective polarization** are more likely to do PL (**H3**)
- ▶ People who are more **exposed to news media** are more likely to do PL (**H4**)
- ▶ People showing higher levels of **cultural consumption** are more likely to do PL (**H5**)

We expect that inferring **others belong to the political out-group** is associated with a decrease in the propensity to:

- ▶ **Interact** with them (**H6**)
- ▶ **Expect a pleasant political conversation** with them (**H7**)

If our expectations were confirmed, they could imply **self-reinforcing dynamics** in the processes of political polarization.

# Data collection - Survey Vignette Experiment

Our survey (N=1096) collects sociodemos, Big Fives, cultural habits, and political variables. Then respondents are shown a vignette:

*"Imagine you are having lunch at a restaurant offering five menus at a fixed price of 20 euros. Each menu includes a first course, a second course, and a side dish. The five menus are:*

**Basic menu:** *pasta with tomato sauce, baked flounder, and mixed salad.*

**Vegan menu:** *farro and quinoa salad, grilled tofu, and sautéed kale.*

**Meat menu:** *charcuterie board, grilled sausage, and baked potatoes with crispy bacon.*

**Traditional menu:** *trenette pasta with Ligurian pesto, eggplant parmigiana, and sautéed chicory with fava beans.*

**Ethnic menu:** *noodles in broth, moussaka, and frijoles with guacamole.*

*As you think about which one to choose, you hear the person sitting at the table next to yours choosing the [Randomly repeats one of the menus reported above]*

To test **the content and directions of PL**: Mann-Whitney U tests on inferred ideology treated as ordinal variable (H1a, H1b, H1c, H1d)

- ▶ Results of the test boring to look at, we present descriptive graphs and discuss the significance.
- ▶ Moreover, we inquire on the reason behind PL through manual coding of open answers provided by the respondents

# Tests of H2, H3, H4, H5

To test hypotheses on the **predictors of PL**: logit regressions with as dependent variables:

- ▶ To say what party the person in the vignette votes for (or "I don't know")
  - ▶ *Partisan PL*  $\Rightarrow$  Any party vs "I don't know"
- ▶ To say what is the political ideology of this person (or "I don't know")
  - ▶ *Ideological PL*  $\Rightarrow$  Any ideology vs "I don't know"

As independent variables:

- ▶ (*Ideologically*) *Collocated*  $\Rightarrow$  Any answer vs Nowhere.
- ▶ *Affective polarization* index (Wagner's (2021) index)
- ▶ *News media exposure*  $\Rightarrow$  High vs Low
- ▶ *Cultural consumption* index

We also control for parties known, political interest, sociodemographics

Testing **consequences of PL** on cross-group interactions: ordinal logit regressions with as dependent variables:

- ▶ Likelihood that the respondent accepts an invitation to have coffee with the character:
  - ▶ *Interaction*  $\Rightarrow$  "Likely", "Neither likely nor unlikely", "Unlikely"
- ▶ Likelihood that political conversation with the character is pleasant:
  - ▶ *Conversation*  $\Rightarrow$  "Likely", "Neither likely nor unlikely", "Unlikely"

# Tests of H6 and H7

As independent variables:

- ▶ First, **Ideological PL**, to see if PL is associated with **Interaction** and **Conversation** overall.
- ▶ Then, on the **subsample** of *those that place themselves either on the left (0-4) or the right (6-10) of the ideological spectrum and place the character either on the left or the right*, we estimate model with **Perceived Out-group** as IV (1 if the character is perceived to be in the opposite ideological side, 0 if in the same ideological side)

We control for:

- ▶ Parties known, political interest, sociodemographics, big five personality traits

# Results - H1

*Basic Menu:* pasta with tomato sauce, baked flounder, and mixed salad.

# Results - H1

*Basic Menu:* pasta with tomato sauce, baked flounder, and mixed salad.

# Results - H1

*Vegan Menu:* farro and quinoa salad, grilled tofu, and sautéed kale.

# Results - H1

*Vegan Menu:* farro and quinoa salad, grilled tofu, and sautéed kale.

# Results - H1

*Meat Menu:* charcuterie board, grilled sausage, and baked potatoes with crispy bacon.

# Results - H1

*Meat Menu:* charcuterie board, grilled sausage, and baked potatoes with crispy bacon.

# Results - H1

*Traditional Menu:* trenette pasta with Ligurian pesto, eggplant parmigiana, and sautéed chicory with fava beans.

# Results - H1

*Traditional Menu:* trenette pasta with Ligurian pesto, eggplant parmigiana, and sautéed chicory with fava beans.

# Results - H1

*Ethnic Menu:* noodles in broth, moussaka, and frijoles with guacamole.

# Results - H1

*Ethnic Menu:* noodles in broth, moussaka, and frijoles with guacamole.

## Manual coding: first four categories

**Projection**

**"Is the same menu I  
would have chosen"**

**Issue**

**"Vegan people usually  
care a lot about  
the environment"**

**Gut**

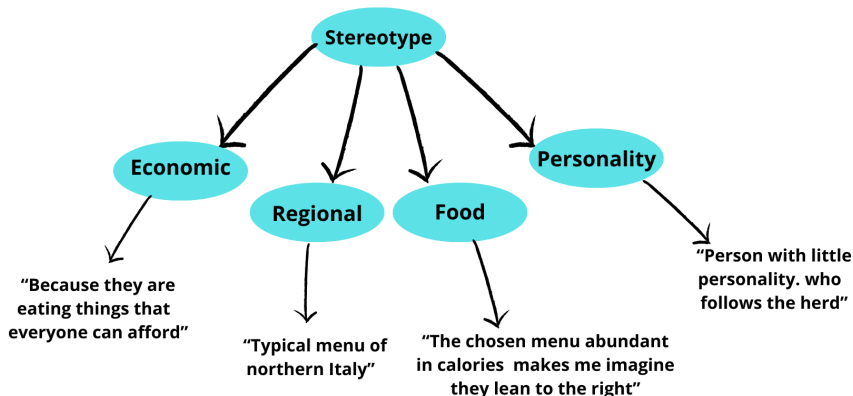

**"It is an intuitive thing,  
it has no rational basis"**

**Other**

**"So many things should  
be said about  
this..."**

# Manual coding: The fifth and largest category

# Results from coding of open answers

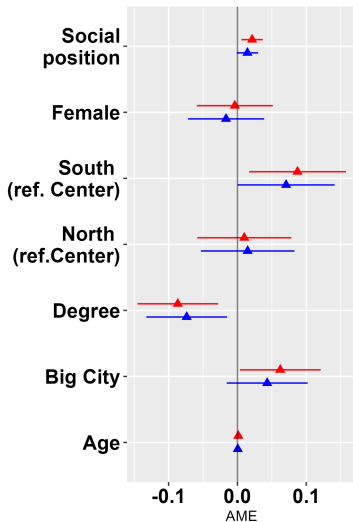

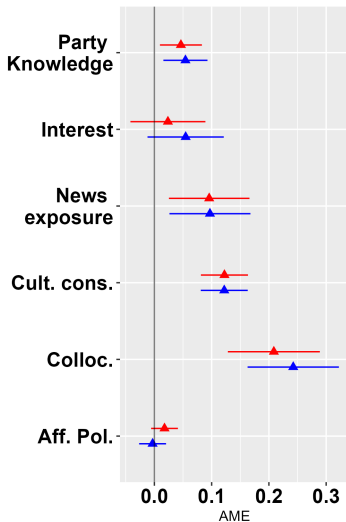

Source of Inference

Type of Stereotype

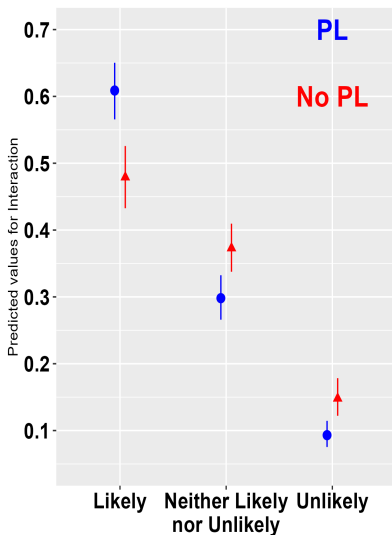

# Results (AMEs) - H2,H3,H4,H5

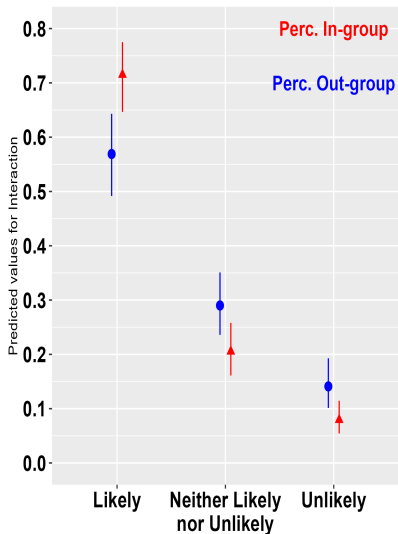

AMEs for models 2a and 2b  
Red triangle = Partisan PL, Blue circle = Ideological PL, 95% C.I.

# Results - H6 and H7 (Id. PL on Int/Conv)

# Results - H6 and H7 (Id. PL on Int/Conv)

# Conclusions

- ▶ **Vegan/ethnic** associated with the left (H1a, H1c ✓)
- ▶ **Meat** associated with the right (H1b ✓).
- ▶ **Traditional food** is not significantly associated with either (H1d ✗).
  - ▶ Probably because national identity is more salient than ideology
- ▶ **Ideology self-placement, Media Exposure, and Cultural Consumption** significantly associated with PL (H2, H4, H5, ✓),
- ▶ **AP** is not (H3 ✗)
  - ▶ Could be a failure of feeling thermometer-based measures (Druckman and Levendusky, 2019; Gidron, 2022)
- ▶ **Inferring out-group membership** is significantly associated with decreasing the likelihood to interact and the expectations regarding the pleasantness of a conversation (H6, H7 ✓).

# Appendix: Self-reinforcing dynamic of Polarization from PL [Link HQ]

## Appendix: details on the survey

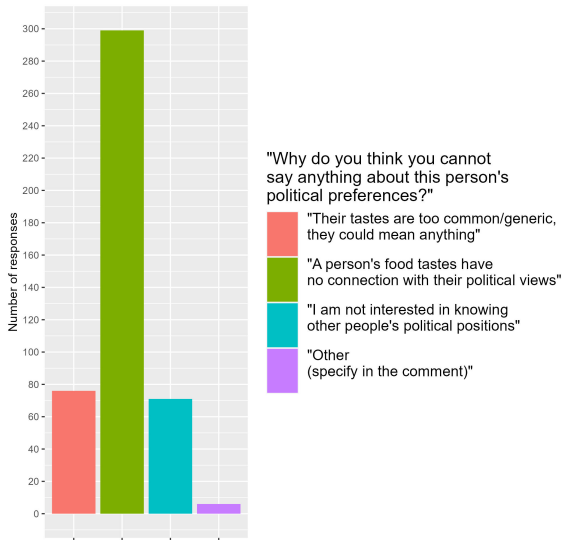

- ▶ We collected our data through a **survey vignette experiment** (N=1092) on a sample of the Italian population.
- ▶ First, we recorded respondents' sociodemographic characteristics, personality traits (Chiorri et al., 2015), cultural consumption habits, interest in politics, political ideology, levels of news media exposure, feeling towards parties, and so on.
- ▶ Then, a vignette of a person choosing a **specific menu** at the restaurant is shown to the respondent. The menu chosen by the character is randomly assigned.

# Appendix: Projection?

# Appendix: Why do they not do PL?

# SAppendix: Details on manual coding 1/2

Category	Definition	Example	Number of cases (%)
Stereotype and other associations (4 sub-categories)	Mentions some kind of stereotypical association (see below)	See below	283 (59.56%)
Projection	Explicitly refers to having performed projection	"Is the same menu I would have chosen"	17 (3.58%)
Issue	Mentions political and policy issues	"Vegan people usually care a lot about the environment"	91 (19.16%)
Gut	Mentions concepts such as "instinct", "gut feelings", "sensations" or similar.	"It is an intuitive <u>thing</u> , it has no rational basis"	63 (13.26%)
Other	Anything that does not fit into other categories	"So many things should be said about this..."	21 (4.42%)

## Appendix: Details on manual coding 2/2

Subcategories of “Stereotype or other associations”			
Category	Definition	Example	Number of cases
Economic	Mentions economic conditions	“Because they are eating things that everyone can afford”	26 (9.06%)
Food	Mentions food characteristics	“The chosen menu abundant in calories makes me imagine they lean to the right”	98 (34.15%)
Personality	Mentions personality or attitudes	“Person with little personality. who follows the herd”	154 (53.65%)
Regional	Mentions Italian regions/macroeconomies	“Typical menu of northern Italy”	9 (3.14%)
